TITLE: Casting of 7 ton ingots of killed steels with closed
shrinkage cavity

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Chernaya
metallurgiya, no.6, 1962, 32-38

TEXT: The possibility of teeming 7 ton ingots with a closed
shrinkage cavity which is sufficiently clean as regards non-metallic
inclusions and segregations to become welded together on rolling
was demonstrated. For insulating the closed shrinkage cavity
from air, a skin of 3 to 5 mm thick would be sufficient but for the
fact that on reheating the ingot such thin skin can melt and,
therefore, the thickness of an insulating layer of 20 to 100 mm is
desirable. The principle of the method is to form a bridge in the
shrinkage cavity soon after teeming. This bridge will divide the
shrinkage cavity into closed and open parts. The closed part will

Card 1/2

Casting of 7 ton ingots ...

S/148/62/000/006/001/005
E071/E435

weld together during rolling so that only the open part of the cavity has to be cut off. Altogether five modifications of teeming practice were tested (described in some detail and illustrated). Depending on the teeming practice, the size of the cut off end varied from 3 to 7%. Subsequent testing of the vertical cross-section of an ingot with closed shrinkage cavity for the segregation of carbon, phosphorus and sulphur showed that the degree of segregation was small and did not exceed the degree of segregation encountered in normal ingots. There are 4 figures.

TITLE: The Slag Protection of Copper Alloys

PERIODICAL: Liteynoye proizvodstvo, 1960, No. 8, pp. 10 - 13

TEXT: The slag cover on melted copper alloys protects from gas absorption and waste. Descriptions of the binary MnO · SiO₂ and the ternary MnO - SiO₂ - Al₂O₃ system are given. Exact data on slag complexes, their chemical formulas and compositions, the charge composition, the acid index and the temperature of the slag formation are given. The waste percentage of copper, zinc, lead and tin in smeltings with and without a dross cover are shown in Table 2. The evaluation of the qualities of alloys made by macroanalysis on stepped samples, the mechanic and microanalysis of test pieces, the determination of the specific gravity and the chemical analysis have confirmed the high efficiency of the slag protection of copper alloys. The properties of copper alloys produced under slag protection and without it during the melting process are compared. This comparison shows that the waste of the metal components is much smaller under the slag protection. There are 2 tables and 1 figure.

PURPOSE: This book is intended to serve as a manual in higher Party schools, and may also be used by general readers interested in widening their knowledge of the given branch of industry.

COVERAGE: This manual was written in accordance with the curriculum of the four-year course entitled "Technology of the Most Important Branches of Industry" given at higher Party schools. The book is divided into two parts: "Metallurgy and Mining of Raw Materials and Fuels" and "Physical Metallurgy and Heat Treatment of Metals." The authors present the fundamentals of the mining and exploitation of the basic raw materials and fuels and the basic principles of metallurgy. There are numerous diagrams and illustrations explaining the basic underground and open pit mining methods. Cross-sections of oil wells show the principles of oil production. The authors trace the flow in the metallurgical industry from the smelting of ores to the final heat treatment of the metals. Special features in producing nonferrous metals and the most commonly used alloys are explained. Problems of corrosion and corrosion prevention are discussed. In the introduction the authors give a brief outline of the new Seven-Year Plan 1959-1965, mentioning the production targets in metallurgy for those years and the new establishments under construction. No references are listed.

TITLE: Preparation and certain properties of lead borate

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 11, 1955,
1933-1937

TOPIC TAGS: boron compound, lead compound, borate, chemical reaction, solid physical
property, chemical composition, endothermic effect, exothermic effect

ABSTRACT: Lead borate $4\text{PbO} \cdot 5\text{B}_2\text{O}_3 \cdot 2.5\text{H}_2\text{O}$ was prepared by reacting lead monoxide with
a 10% solution of B_2O_3 in H_3BO_3 . The effect of B_2O_3 concentration, temperature, and
duration of the reaction on the composition of the product was studied. Lead borate
was found to be practically insoluble in water; excess boric anhydride present in the
lead borate obtained is washed out in water. Heating curves of lead borates were
plotted, and the endothermic effects and one exothermic effect (a solid-state phase
transition) are discussed. Heat capacity and thermal conductivity were determined at
100, 200, 300, and 350°C. Orig. art. has: 3 figures, 2 tables.

SOURCE: Ref. zh. Elektronika i yeye primeneniye, Abs. 5V10

REF SOURCE: Elektrotermiya. Nauchno-tekhn. sb., vyp. 46, 1965, 22-25

TOPIC TAGS: electron beam melting, electron gun

ABSTRACT: Since 1959, a number of researches on electron-beam heating have been carried out at the Department of Electrothermal Outfits, MEI. These results are reported: (1) Methods have been developed and apparatus constructed for investigating high-power electron-optical systems; (2) Several electron guns from 75 to 500 kw were developed; (3) Technological characteristics of the electron melting outfit have been thoroughly investigated; (4) The power balance in the electron melting outfit has been investigated which has permitted developing methods for finding the outfit parameters; (5) Specifications for the power supply sources for high-power electron guns have been studied and formulated. TITLE: Conference of refrigeration engineers in East Germany.
(Konferentsiya kholodil'shchikov GDR).

PERIODICAL: "Kholodil'naya Tekhnika" (Refrigeration Engineering),
1957, No.1, pp.61-68 (U.S.S.R.)

ABSTRACT: Report of a Conference of refrigeration engineers held
in Leipzig in September, 1956. Over 200 people participated
including people from West Germany and other countries. The
report contains summaries of two papers read by West German
delegates and of four papers read by East German delegates
and also information on cold store facilities in East Germany
with a detailed description of a standard cold store of
6400 m² floor space, a photo of which is shown in Fig.2, p.64.
Furthermore, brief mention is made of exhibits in this field
at the West Germany Industrial Exhibition, Berlin, 1956.
There are eight figures and two tables.

Reinforced frothed-glass concrete. N. TRACHEV AND P.

PIROV. Kholevskaya Letn., 30 [2] 40-62 (1953). Applications
of reinforced frothed-glass concrete (material made from cement,
water, sand, and chips of frothed glass) are discussed. After 20

heat-shock cycles, crushing strength dropped 11%, water absorption did not exceed 23 to 27% by weight, bulk weight was 1000
kg./m.³, and thermal conductivity was 0.273 cal./in.hr.°C.

 Tech. Ed.; V. V. Bubchenko.

NOTES: This collection of articles is intended for those interested in the problems of food refrigeration.

CONTENTS: The collection contains 26 reports which were submitted at the meeting of the 4th, 5th, and 6th Committees of the International Partition of Refrigeration. The meeting was held in Moscow, September 1-6, 1953, and was attended by 25 Soviet specialists and 135 representatives from other countries. The 75 reports discussed at this meeting cover such broad areas as the automation of the cooling of refrigerating equipment, the use of finned-tube type participating devices, the freezing and preservation of theory and techniques of meat cooling and freezing of meat and fish, the refrigeration and cooling of systems. A complete account of the proceedings of this meeting was published by the International Institute of Refrigeration in 1955. No personalities are mentioned. References follow.

TITLE: Characteristics of built-in alfa calorimeters

SOURCE: Ref. zh. Vodnyy transport, Abs. 3V86

REF SOURCE: Tr. Tsentr. n.-i. in-ta morsk. flota, vyp. 62, 1965, 34-47

TOPIC TAGS: turbine engine, heat transfer, thermal process, thermal analysis, calorimeter, heat exchanger, temperature coefficient, specific heat, HEAT TRANSFER COEFFICIENT

ABSTRACT: The limiting conditions for heat transfer must be known in order to determine the thermal load on the elements of a turbine drive machine. The behavior patterns for the regular thermal condition can be used to determine the heat emission coefficient, using special, built-in, sensors installed in the body subject to thermal activity in such a way that the heat-sensing end is level with the surface of the heat exchanger. Other surfaces are heat insulated. The alfa calorimeter is such a sensor. Investigations have established (1) that the characteristics of built-in alfa calorimeters plotted in accordance with the analytical dependency $Bi = \varphi(P)$, where Bi is a measure of the intensity of the effect of the medium on the alfa calorimeter, and P is a measure of the reaction of the sensor to this effect, can be used for an experimental determination of local values for the heat emission

Card 1/2

coefficients, and (2) that the curvature of the heat exchanger surface has an effect on the characteristics of the alfa calorimeter. This effect can be neglected for values of $\epsilon > 0.95$ to 0.9, where $\epsilon = R_1/R_2$ (R_1 is the internal radius of the sensor, in meters; R_2 is the external radius, in meters), without substantial error (less than 5%); (3) that the simple dependencies $\alpha = x \cdot c \cdot \rho \cdot m \cdot \delta$, or $Bi = x \cdot P^2$, are correct in the range of values for Bi to 0.15 with an accuracy of up to 5%, where $x = 1.0$ for a flat sensor, $X = 1 + \epsilon/2$ for a convex sensor, and $X = 1 + \epsilon/2\epsilon$ for a concave sensor, and where c is the specific heat for the sensor material in watts/degree/kg, ρ is material density in kg/m³, δ is the height of the sensor, in meters, and m is the cooling (heating) rate, in liters/hour; and (4) that in the range of values for Bi of 1.0 to 1.5 the duration and the temperature interval of regularization is small, making it possible to determine the rate of change of temperature with acceptable accuracy. 7 figures. TITLE: On Combined Work in Mountainous Areas
(O kompleksnoy rabote v gornykh rayonakh)

PERIODICAL: Geodeziya i kartografiya, 1959, Nr 8, pp 41-42 (USSR)

ABSTRACT: In mountainous regions it is useful to have one person carry out all the field work in stereotopographical surveying. This person has to study in advance the section on the basis of the material at hand and has to get to know the project of site and altitude preparation for aerial photographs. The following composition of a brigade is enough for the development of an analytical net: 1 topographer, 1 foreman, and two workers of the third class. An additional worker is necessary, however, on account of the ravines. Workers must be given instruction on safety regulations. At the center of the section a provisions post must be erected so that it is not necessary for the workers to return again and again to the base. The entire section has to be divided into routes for 5-7 days at most. The "emergency ration" has to last for 2 days under all circumstances.

Card 1/2

Use of methionine in the treatment of patients with Botkin's disease [infectious hepatitis]. P.G. Tkachev. *Soviet Med.* 19, No. 12, 68-70 (1955).—On the theory that orally administered methionine (I), by making available labile methyl groups, counteracts the inhibition of lipotropic amino acid and choline synthesis in the infected liver, 52 patients with Botkin's disease were treated and 50 recovered after administration of I with pancreatin and glucose. Dosage of I ranged from 2 g. daily (total 12-15 g.) in mild cases to 6 g. daily (total 32-45 g.) in severe cases. In mild and moderate cases blood bilirubin titer dropped abruptly after 3-4 days of treatment and returned to normal after 14-18 days. I is recommended for treatment of all such cases.

TITLE: Effect of temperature on SNP thermoplastic

SOURCE: Plasticheskiye massy*, no. 7, 1963, 55-58

TOPIC TAGS: SNP thermoplastic, tensile stress, GOST 4646-49

ABSTRACT: Authors tested the stability of SNP-284 thermoplastic at temperatures from 0 to 60°C. The effect of temperature on its maximum tensile stress and specific impact strength was determined. Samples were used which were produced from a sheet. Shape and size corresponded to GOST 4646-49. The samples were fractured on a TsDM-10 machine which had a maximum force of 2000 kg and deformation rate of 10 mm/min. in a special thermostat. A photograph of the machine is included in the article. Authors then construct curves for the data obtained in these tests and discuss each curve in detail. Orig. art. has: 8 figures and 2 tables.

TITLE: Deep-drawability of sheet steel produced by continuous casting

SOURCE: Kuznechno-shtampovochnoye proizvodstvo, no. 11, 1965, 19-24

TOPIC TAGS: continuous casting, cast steel, metal stamping, metal drawing, ~~automotive~~, sheet metal, metal casting

ABSTRACT: The article presents the results of an investigation of the properties and stampability of cold-rolled sheet steels 08kp, 10kp, 081kp and 08ps, produced by the continuous casting method as compared with steel obtained from conventionally cast ingots. Stampability was investigated at the pressforging shop of the Minsk Low-Displacement Motor Vehicle Plant. Prior to the deep drawing of intricately shaped automotive body parts the specimens were subjected to mechanical tests and metallographic examinations which showed that sheet steel produced by continuous casting meets the requirements of the standards for quality structural sheet steel and that its ferrite grains are of a sufficiently small size to favorably affect the quality of the surface of elements during their deep drawing. conditions was determined during the drawing of a number of components of the Moskvich car: an analysis of the stress-strain diagram during drawing established that the plasticity margin of the metal is comparatively high during the embossing of most of the components investigated. An exception is the stress-strain diagram during the die-stamping of lower crankcases. The deep drawing of the crankcase involves limiting values of the plasticity margin in a number of sectors of the component and in some cases the embossing culminates in total exhaustion of the metal's plasticity. Compared with steel deriving from conventionally cast ingots, the proportion of defective components fabricated from steel produced by continuous casting was appreciably lower. These findings point to a satisfactory stampability of steel produced by continuous casting and the possibility of using this steel for the deep drawing of elements fabricated from metal meeting the (lower) requirements of the All-Union State Standard GOST 914-56. Orig. art. has: 5 figures, 3 tables.
